Fall 2009

# Project Overview

- Create an OpenSceneGraph plug-in
  - Utilizes sparse virtual texturing techniques
  - Efficiently use high resolution textures
- Create an Application
  - OSG example
  - Demonstrate functionality

# Problem

- Using High Resolution Textures
- Graphics Card Requirements
  - Wants entire texture to draw the scene
  - Wants textures that fit in memory
- Current Methods
  - Tedious
  - Inefficient

# Solution

- Pre-process Image
  - BSVT format
  - Stream from disc efficiently
- Pre-render Scene
  - Check used parts of texture
  - Stream needed, non-present parts

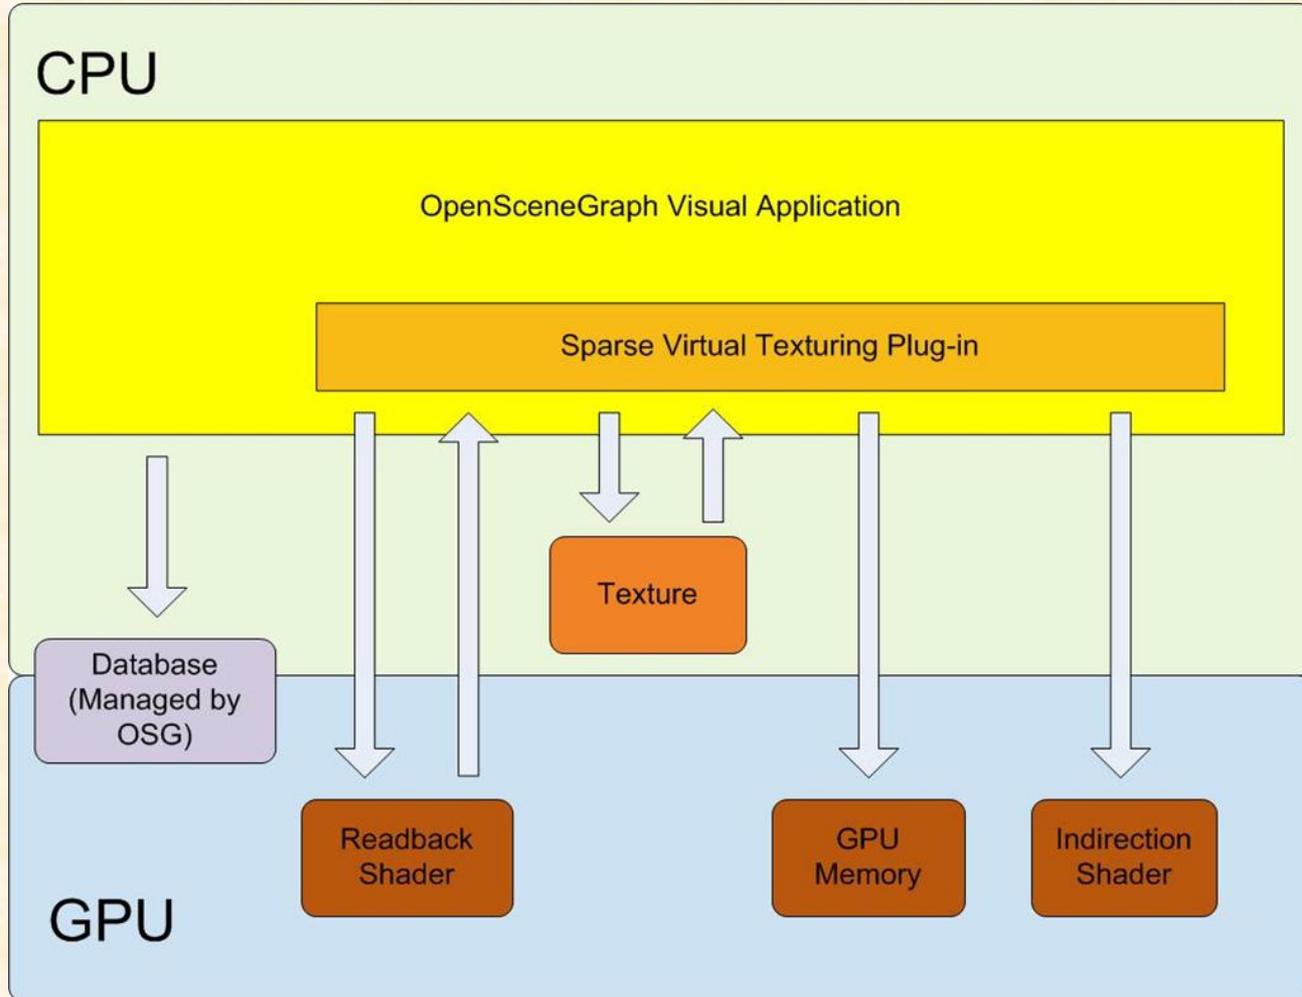

# Solution

- Update Scene Texture
  - Replace present, unused parts
  - Pass updated texture to indirection shader
- Indirection Shader
  - Contains page table
  - References scene texture
  - Corresponds texture coordinate with scene texture

# Building The Page Table

---

- For each mip level :

If the page is present in the scene texture:

- Record its location in the scene texture
- Set the “bias” to 0

Otherwise:

- Iterate through subsequent mip levels until the requested page is present
- Record lower resolution page's location in the scene texture
- Record the “bias”
