Whiteglove gets to green, but after reseal loads local user creation page?

I'm at my wits end with Autopilot/Intune/Whiteglove recently but here goes :)

I have created an Autopilot profile that has Whiteglove enabled. When I go through a normal Autopilot deployment on a device, the device registers into Intune, apps and everything gets deployed (except the Windows 10 Enterprise Key from M365 E5 license, which I have a ticket with MS open for). I can see the naming convention gets assigned and it works like we would expect.

When I use Whiteglove from that Autopilot deployment profile, the device runs through steps and the ESP is shown, stating it joins MDM, installs some apps, security policies etc, and then I get the chance to reseal on the green screen. Upon turning on the device again, a login page is shown to create a local user - not the Autopilot landing page that is expected from the tenancy. Upon checking Intune, the naming convention isn't applied (it gets set to DESKTOP-%RAND% instead), and I can't log on with any Azure AD accounts. In Accounts, I can't see the device connected to Azure AD, but in Azure AD itself I can see the device listed as Azure AD Joined.

Funnily enough, my device gets upgraded to Windows 10 Enterprise.

Some more info

↳ All users are licensed with Microsoft 365 E5.

↳ This was tested on WiFi and ethernet, same result.

↳ We have security baselines in place for Windows 10 and MDATP.

I'm currently working on multiple projects, and at another one of them Whiteglove deployment works fine. Anyone else had brain numbing issues like this?

The screenshot displays the Microsoft Feedback Analysis Hub interface. At the top left is the Microsoft logo. Below it is a blue header bar with the text "Feedback Analysis Hub Microsoft Intune". The main content area features a row of four navigation buttons: "Home" (with a house icon), "Twitter Feedback" (with a Twitter bird icon), "Reddit Feedback" (with a Reddit alien icon), and "Download Raw Data" (with a download icon and a dark grey background). Below this row are two more buttons: "Download Reddit Data" and "Download Twitter Data".

What's left to do?

- Finish the feature for filtering and searching Twitter posts by keywords
- Add sentiment analysis report for each post presented on website
- Automating data visualization
- Implement button for the database to go live
