Michigan State University

Spring 2023

*From Students...
...to Professionals*

Project Sponsor Overview

- Amazon is the largest e-commerce company in the U.S- based in Seattle, Washington
- Amazon employs 1.5 million people worldwide
- Generates over half a trillion dollars in revenue each year provides cloud services and smart products
- Focuses on principles like customer obsession, invent and simplify, insisting on high standards

Project Functional Specifications

- Introduce a group buy tool for Amazon shopping experience
- Split costs with other Amazon users and buy products
- Organizations will be able to raise money on Amazon
- This tool will promote expensive purchases leading to larger revenue from online marketplace

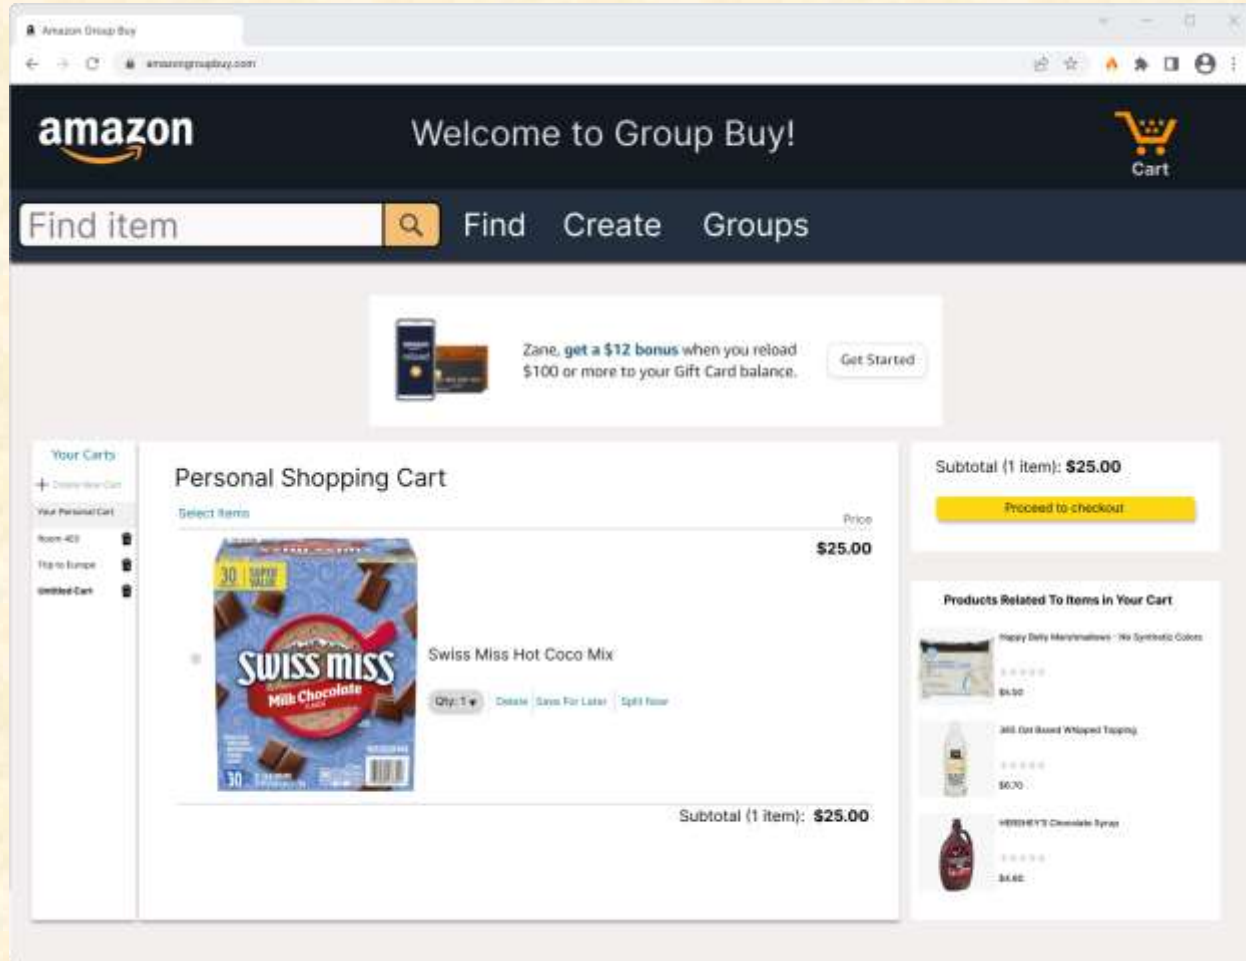

Project Design Specifications

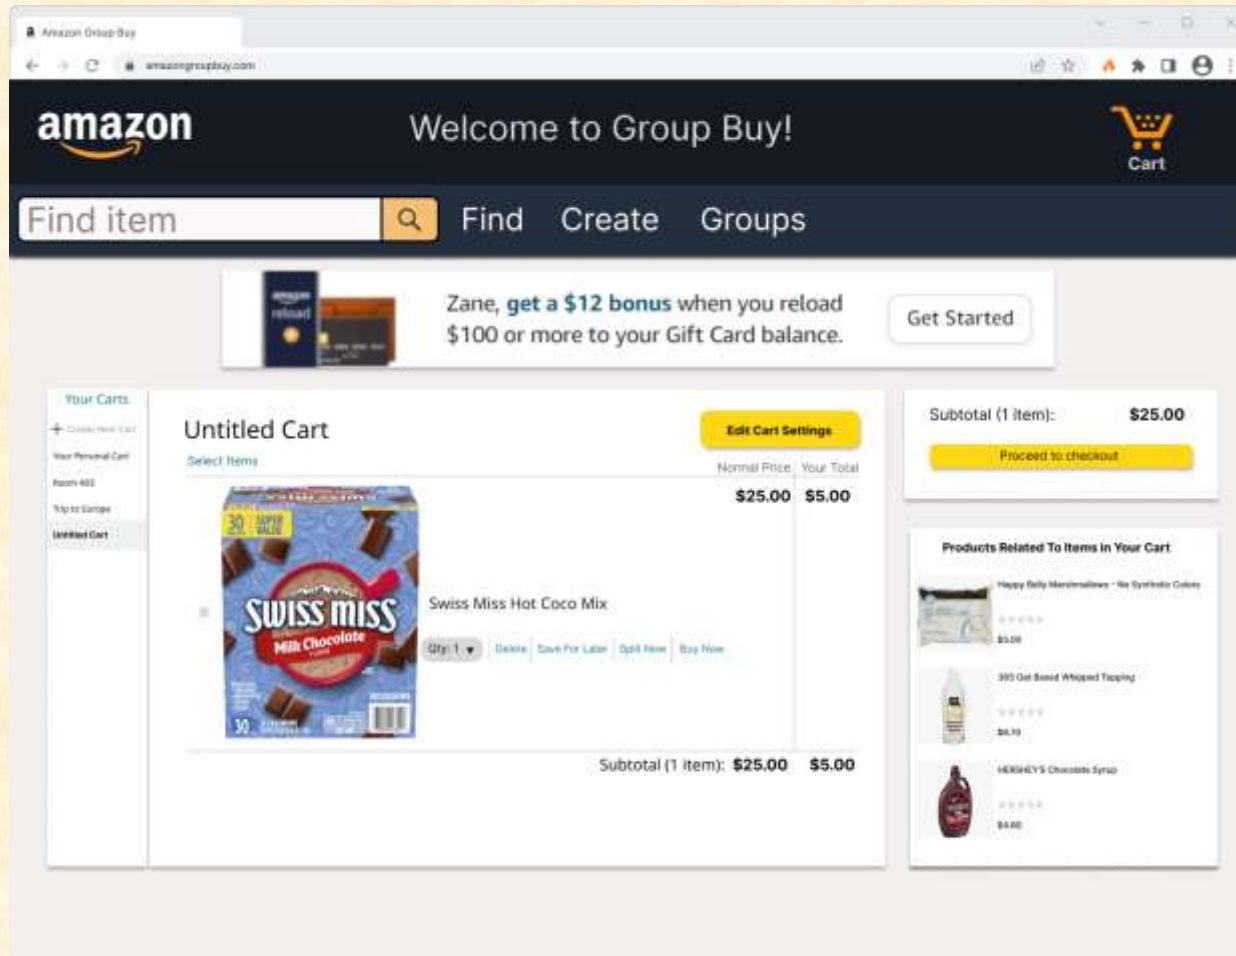

- Users can create carts and add members
- Ability to split costs swiftly for single time use
- Be able to search groups and join them
- Use the split now button to manage costs for each member

Project Technical Specifications

- Full stack web application
- Utilizes different frameworks, programming languages, and Amazon Web Services (AWS)
- User Interface powered by ReactJS and hosted by AWS Amplify with AWS Cognito for user login
- AWS Lambda will allow connection to other AWS
- AWS API Gateway will host REST APIs, allowing for end to end connection
- Create product recommendations through ML Model deployed on AWS SageMaker

Project System Architecture

Project System Components

- Software Platforms / Technologies
 - Programming Languages – Java, Python
 - Front-End – AWS Cognito, Figma, ReactJS, AWS Amplify
 - Application Integration – AWS API Gateway
 - Cloud Compute Functions – AWS Lambda
 - Database – DynamoDB, API Search API
 - Machine Learning – PyTorch, AWS SageMaker

Project Risks

- Amazon User Authentication
 - Unfamiliarity in implementation of user authentication and verification for a web application
 - Explore AWS Cognito for authenticating user login
- Email Notification
 - Implement email notifications for group buy tool. Incorrect implementation will risk transparency for the user
 - Explore different AWS APIs that could aid in implementing the system
- Integration of Application Components
 - With a large amount of web service being used for the tool, integration can pose a challenge if each component is not correctly linked each other
 - Extensive research of best practices of AWS and begin integration early on in the process
